Operating System Overview

Chapter 2

Operating System

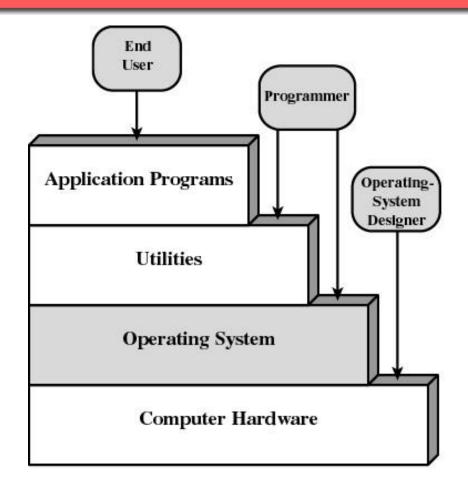

- A program that controls the execution of application programs
- An interface between applications and hardware

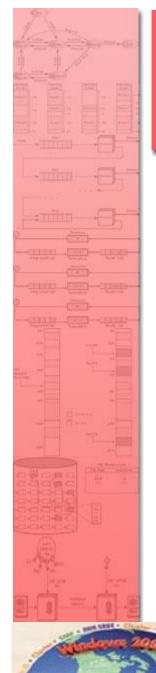

Operating System Objectives

- Convenience
 - Makes the computer more convenient to use
- Efficiency
 - Allows computer system resources to be used in an efficient manner
- Ability to evolve
 - Permit effective development, testing, and introduction of new system functions without interfering with service

Layers of Computer System

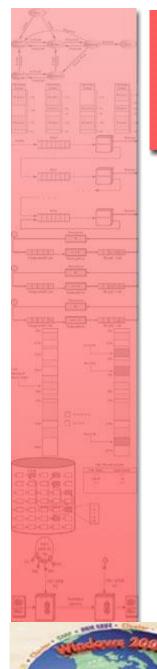

Services Provided by the Operating System

- Program development
 - Editors and debuggers
- Program execution
- Access to I/O devices
- Controlled access to files
- System access

Services Provided by the Operating System

- Error detection and response
 - internal and external hardware errors
 - memory error
 - device failure
 - software errors
 - arithmetic overflow
 - access forbidden memory locations
 - operating system cannot grant request of application

Services Provided by the Operating System

- Accounting
 - collect statistics
 - monitor performance
 - used to anticipate future enhancements
 - used for billing users

Operating System

- Functions same way as ordinary computer software
 - It is program that is executed
- Operating system relinquishes control of the processor to execute other programs

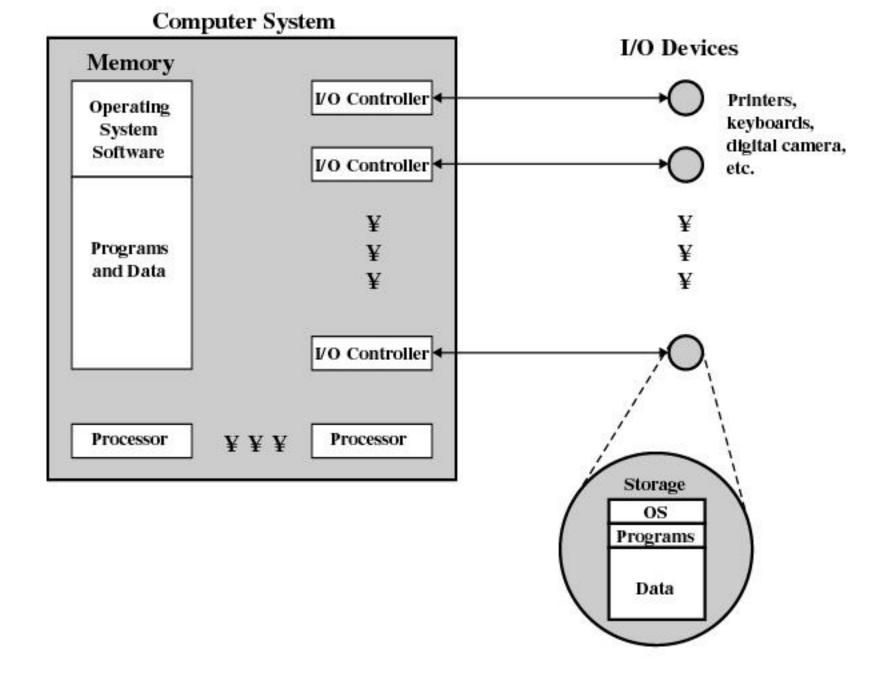

Figure 2.2 The Operating System as Resource Manager

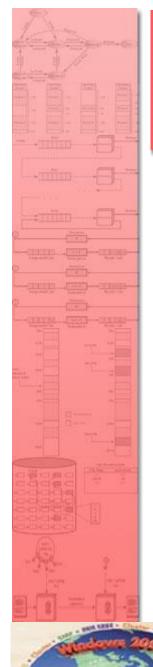

Kernel

- Portion of operating system that is in main memory
- Contains most-frequently used functions
- Also called the nucleus

Evolution of an Operating System

- Hardware upgrades and new types of hardware
- New services
- Fixes

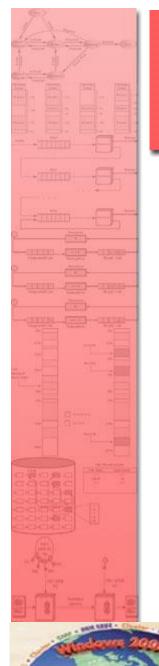

Evolution of Operating Systems

- Serial Processing
 - No operating system
 - Machines run from a console with display lights and toggle switches, input device, and printer
 - Schedule time: sign up sheets
 - Setup included loading the compiler, source program, saving compiled program, and loading and linking

Evolution of Operating Systems

- Simple Batch Systems
 - Monitors
 - Software that controls the running programs
 - Batch jobs together
 - Program branches back to monitor when finished
 - Resident monitor is in main memory and available for execution

Job Control Language (JCL)

- Special type of programming language
- Provides instruction to the monitor
 - what compiler to use
 - what data to use

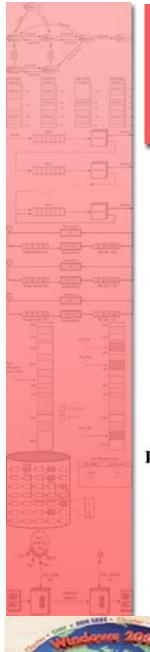

Hardware Features

- Memory protection
 - do not allow the memory area containing the monitor to be altered
- Timer
 - prevents a job from monopolizing the system

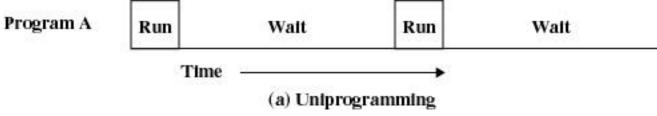

Hardware Features

- Memory protection
 - do not allow the memory area containing the monitor to be altered
- Timer
 - prevents a job from monopolizing the system

Uniprogramming

 Processor must wait for I/O instruction to complete before proceeding

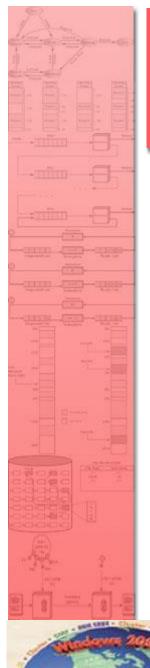

Multiprogramming

• When one job needs to wait for I/O, the processor can switch to the other job

Multiprogramming Program A Wait Wait Run Run Program B Wait Wait Wait Run Run Program C Wait Wait Wait Run Run Run Run Run Run Run Combined Wait Walt Time (c) Multiprogramming with three programs

Example

JOB1	JOB2	JOB3
· · ·		0020

Type of job Heavy compute Heavy I/O Heavy I/O

Duration 5 min. 15 min. 10 min.

Memory required 50K 100 K 80 K

Need disk? No No Yes

Need terminal No Yes No

Need printer? No No Yes

Effects of Multiprogramming

Uniprogramming Multiprogramming

Processor use 22% 43%

Memory use 30% 67%

Disk use 33% 67%

Printer use 33% 67%

Elapsed time 30 min. 15 min.

Throughput rate 6 jobs/hr 12 jobs/hr

Mean response time 18 min. 10 min.

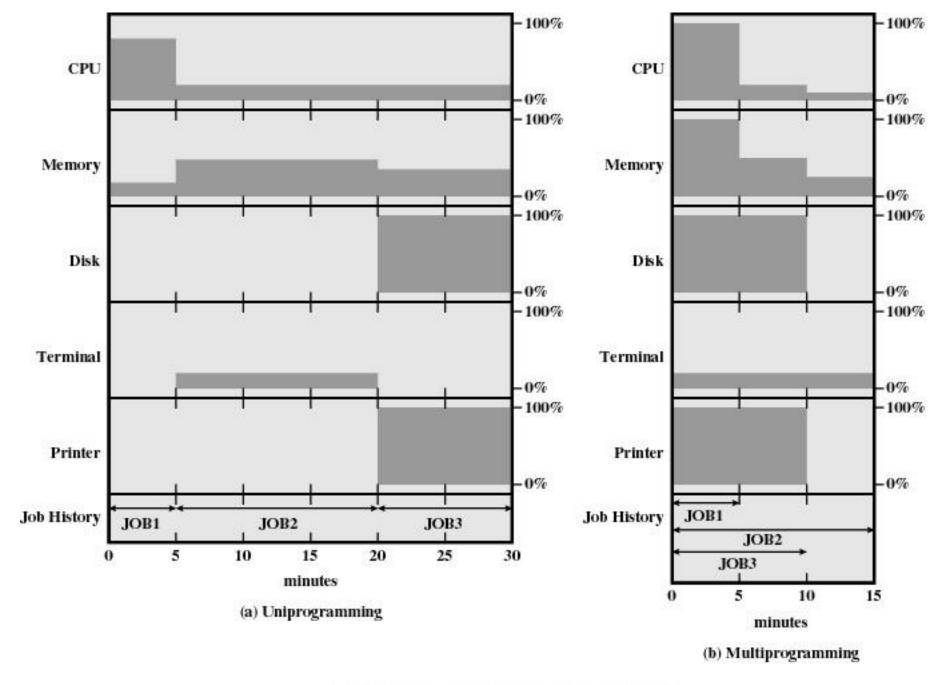

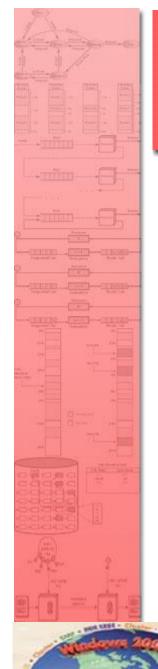

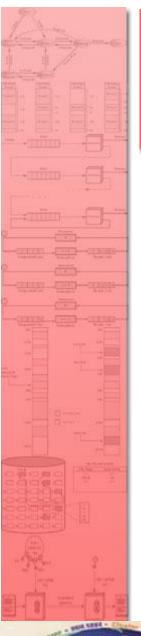

Figure 2.6 Utilization Histograms

Time Sharing

- Using multiprogramming to handle multiple interactive jobs
- Processor's time is shared among multiple users
- Multiple users simultaneously access the system through terminals

Batch Multiprogramming versus Time Sharing

	Batch Multiprogramming	Time Sharing
Principal objective	Maximize processor use	Minimize response time
Source of directives to operating system	Job control language commands provided with the job	Commands entered at the terminal

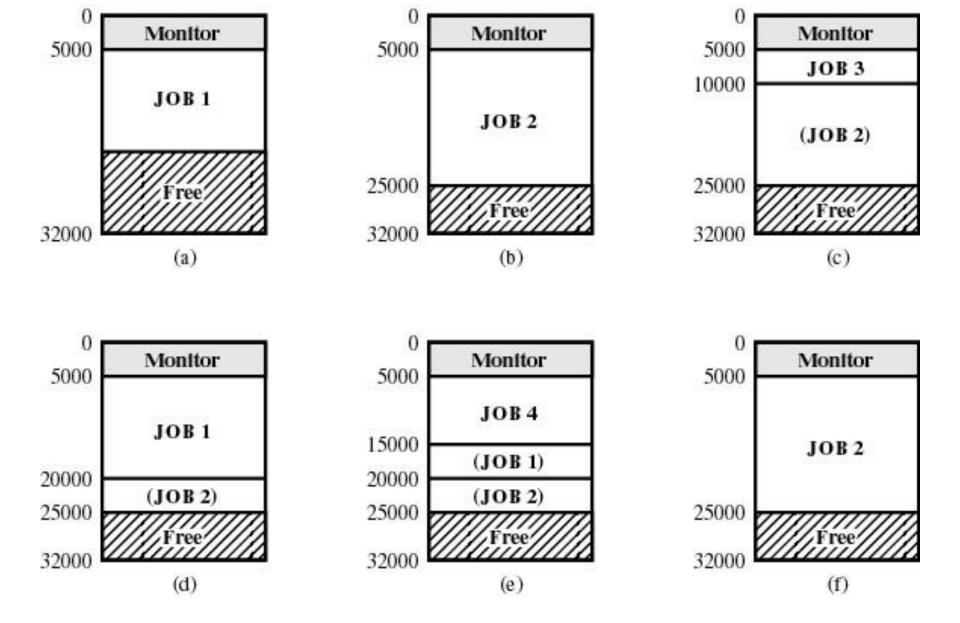

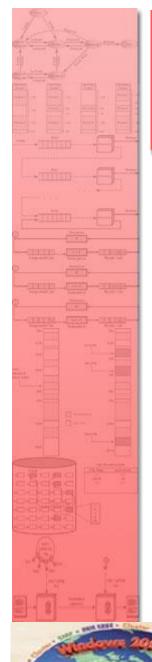

Figure 2.7 CTSS Operation

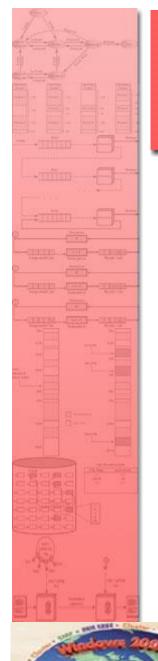

Major Achievements

- Processes
- Memory Management
- Information protection and security
- Scheduling and resource management
- System structure

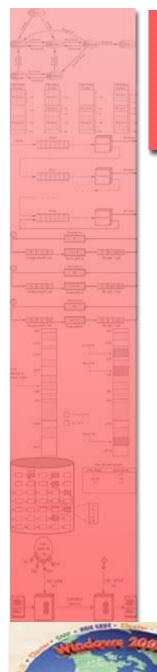

Processes

- A program in execution
- An instance of a program running on a computer
- The entity that can be assigned to and executed on a processor
- A unit of activity characterized by a single sequential thread of execution, a current state, and an associated set of system resources

Difficulties with Designing System Software

- Improper synchronization
 - ensure a process waiting for an I/O device receives the signal
- Failed mutual exclusion
- Nondeterminate program operation
 - program should only depend on input to it,
 not relying on common memory areas
- Deadlocks

Process

- Consists of three components
 - An executable program
 - Associated data needed by the program
 - Execution context of the program
 - All information the operating system needs to manage the process

Process

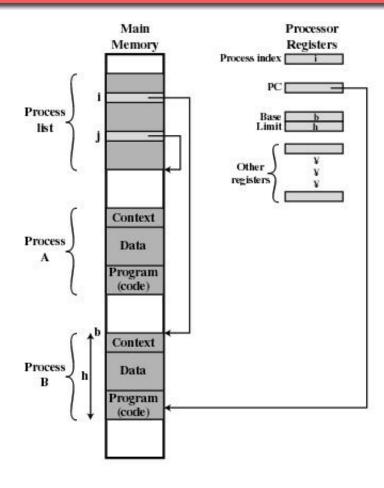

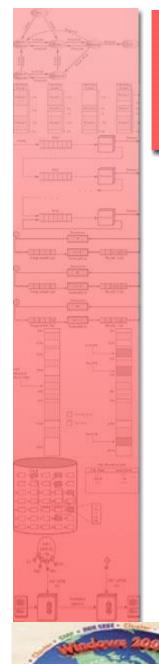

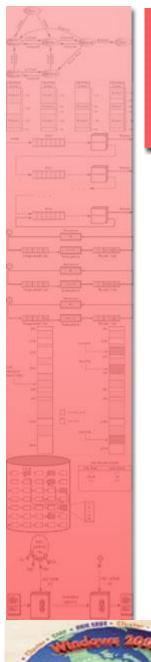

Figure 2.8 Typical Process Implementation

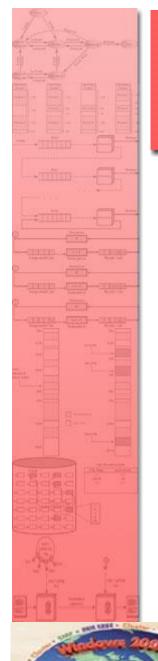

Memory Management

- Process isolation
- Automatic allocation and management
- Support for modular programming
- Protection and access control
- Long-term storage

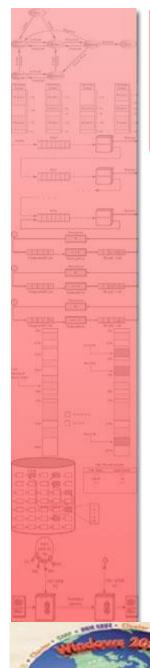

Virtual Memory

- Allows programmers to address memory from a logical point of view
- While one process is written out to secondary store and the successor process read in there in no hiatus

File System

- Implements long-term store
- Information stored in named objects called files

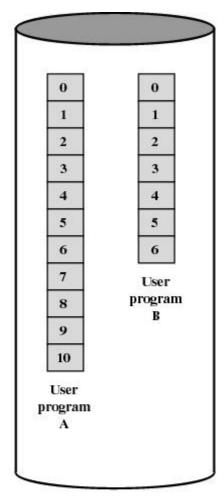

Paging

- Allows process to be comprised of a number of fixed-size blocks, called pages
- Virtual address is a page number and an offset within the page
- Each page may be located any where in main memory
- Real address or physical address in main memory

	A.5		
B.0	B.1	B.2	В.3
		A.7	
	A.9		
12		A.8	
B.4	B.5	B.6	

Main Memory

Main memory consists of a number of fixed-length frames, equal to the size of a page. For a program to execute, some or all of its pages must be in main memory.

Disk

Secondary memory (disk) can hold many fixed-length pages. A user program consists of some number of pages. Pages for all programs plus the operating system are on disk, as are files.

Figure 2.9 Virtual Memory Concepts

Virtual Memory Addressing

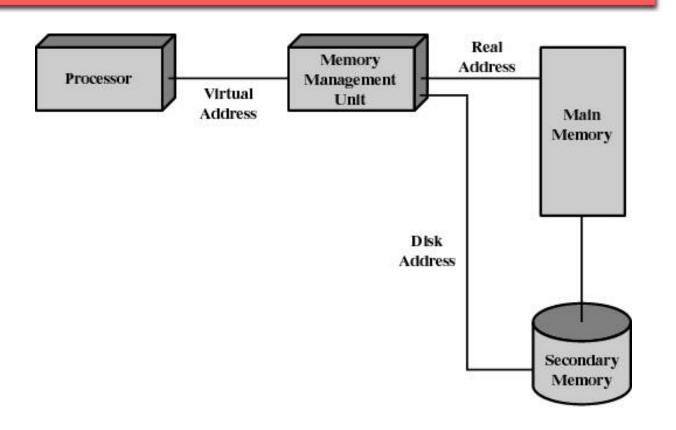

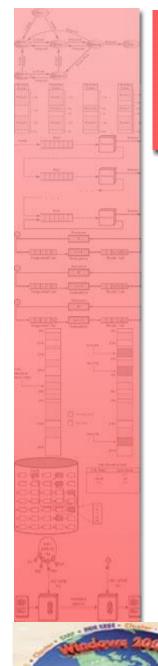

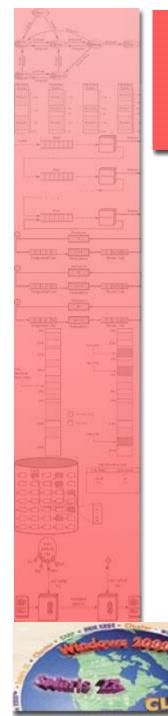

Figure 2.10 Virtual Memory Addressing

Information Protection and Security

- Access control
 - regulate user access to the system
- Information flow control
 - regulate flow of data within the system and its delivery to users
- Certification
 - proving that access and flow control perform according to specifications

Scheduling and Resource Management

- Fairness
 - give equal and fair access to all processes
- Differential responsiveness
 - discriminate between different classes of jobs
- Efficiency
 - maximize throughput, minimize response time, and accommodate as many uses as possible

Major Elements of Operating System

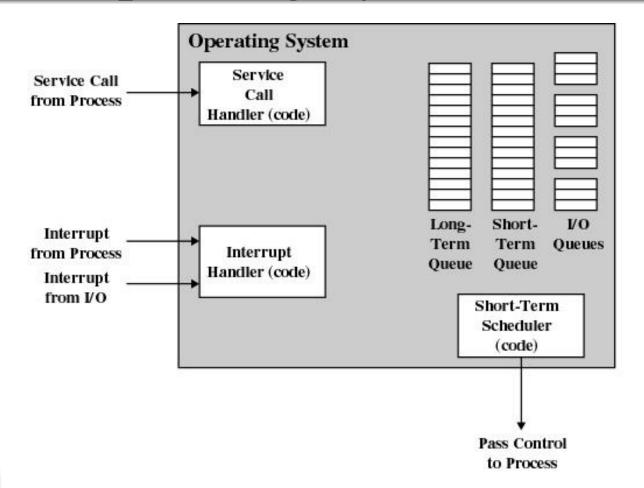

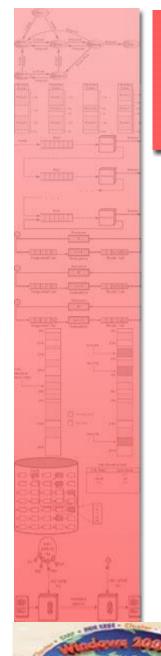

Figure 2.11 Key Elements of an Operating System for Multiprogramming

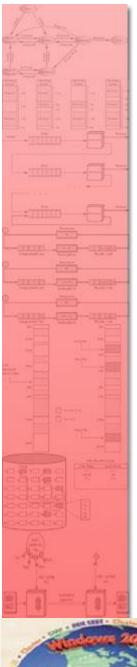

System Structure

- View the system as a series of levels
- Each level performs a related subset of functions
- Each level relies on the next lower level to perform more primitive functions
- This decomposes a problem into a number of more manageable subproblems

Operating System Design Hierarchy

	Level	Name	Objects	Example Operations
	13	Shell	User programming environment	Statements in shell language
	12	User processes	User processes	Quit, kill, suspend, resume
	11	Directories	Directories	Create, destroy, attach, detach, search, list
	10	Devices	External devices, such as printer, displays and keyboards	Open, close, read, write
	9	File system	Files	Create, destroy, open, close read, write
S Intel	8	Communications	Pipes	Create, destroy, open. close, read, write

Operating System Design Hierarchy

	Level	Name	Objects	Example Operations
	7	Virtual Memory	Segments, pages	Read, write, fetch
	6	Local secondary store	Blocks of data, device channels	Read, write, allocate, free
Married Control of the Party and the Party a	5	Primitive processes	Primitive process, semaphores, ready list	Suspend, resume, wait, signal

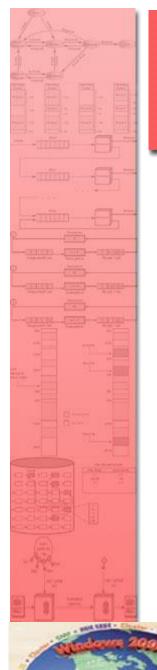

Operating System Design Hierarchy

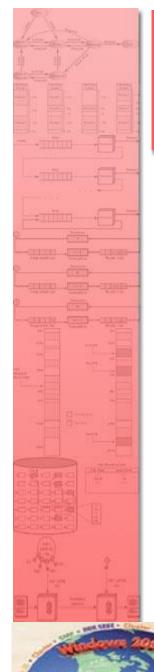

Level Name		Objects	Example Operations
4	Interrupts retry programs	Interrupt-handling	Invoke, mask, unmask,
3	Procedures	Procedures, call stack, display	Mark stack, call, return
2	Instruction Set	Evaluation stack, micro- program interpreter, scalar and array data	Load, store, add, subtract branch
1	Electronic circuits	Registers, gates, buses,	Clear, transfer, activate,

etc.

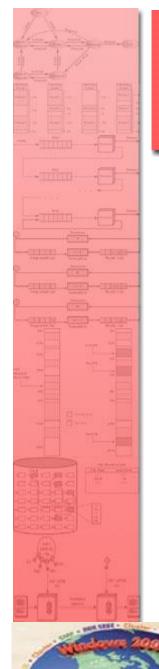

complement

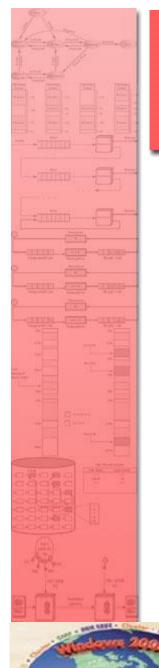

- Microkernel architecture
 - assigns only a few essential functions to the kernel
 - address space
 - interprocess communication (IPC)
 - basic scheduling

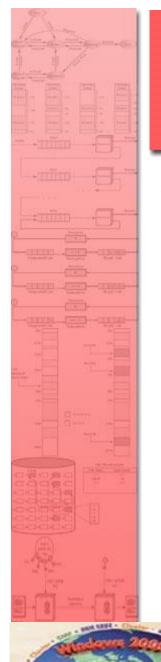

- Multithreading
 - process is divided into threads that can run simultaneously
- Thread
 - dispatchable unit of work
 - executes sequentially and is interruptable
- Process is a collection of one or more threads

- Symmetric multiprocessing
 - there are multiple processors
 - these processors share same main memory and I/O facilities
 - All processors can perform the same functions

- Distributed operating systems
 - provides the illusion of a single main memory and single secondary memory space
 - used for distributed file system

- Object-oriented design
 - used for adding modular extensions to a small kernel
 - enables programmers to customize an operating system without disrupting system integrity

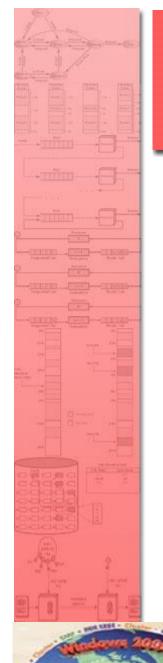

Windows 2000

- Exploits the power of today's 32-bit microprocessors
- Provides full multitasking in a singleuser environment
- Client/Server computing

Windows 2000 Architecture

- Modular structure for flexibility
- Executes on a variety of hardware platforms
- Supports application written for a variety of other operating system

OS Organization

- Modified microkernel architecture
 - Not a pure microkernel
 - Many system functions outside of the microkernel run in kernel mode
- Any module can be removed, upgraded, or replaced without rewriting the entire system

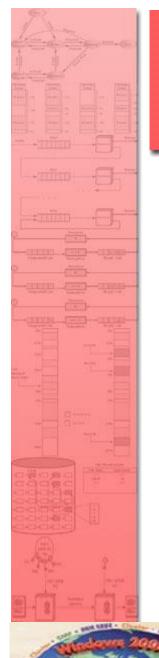

Layered Structure

- Hardware abstraction layer (HAL)
 - Isolates the operating system from platform-specific hardware differences
- Microkernel
 - Most-used and most fundamental components of the operating system
- Device drivers
 - Translate user I/O function calls into
 specific hardware device I/O requests

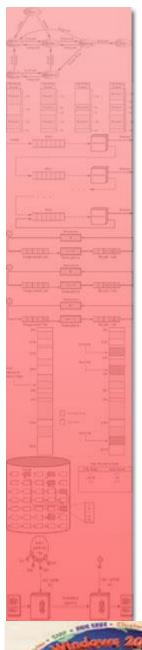

W2K Executive

- I/O manager
- Object manager
- Security reference monitor
- Process/thread manager
- Local procedure call (LPC) Facility
- Virtual memory manager
- Cache manager
- Windows/graphics modules

User Processes

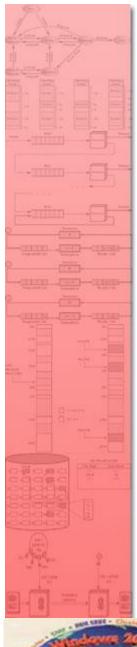

- Special system support processes
 - Ex: logon process and the session manager
- Server processes
- Environment subsystems
- User applications

Client/Server Model

- Simplifies the Executive
 - possible to construct a variety of APIs
- Improves reliability
 - each service runs as a separate process with its own partition of memory
 - clients cannot not directly access hardware
- Provides a uniform means fro applications to communicate via LPC
- Provides base for distributed computing

Threads and SMP

- Different routines can execute simultaneously on different processors
- Multiple threads of execution within a single process may execute on different processors simultaneously
- Server processes may use multiple threads
- Share data and resources between process

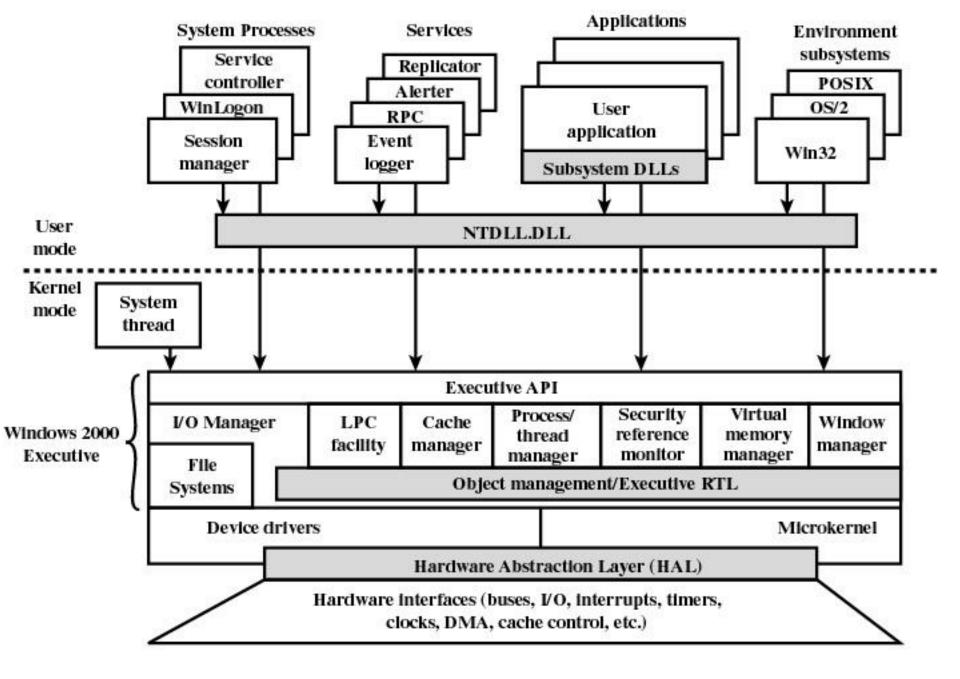

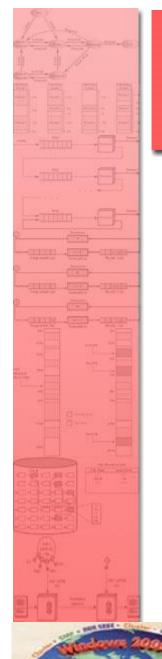

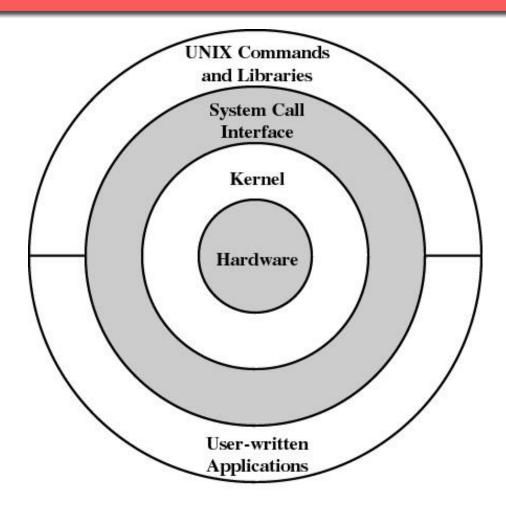

Figure 2.13 Windows 2000 Architecture

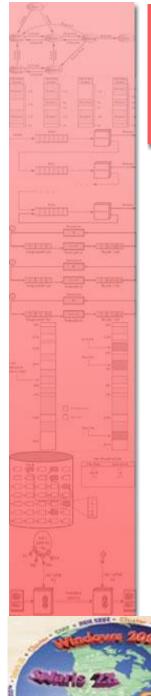

UNIX

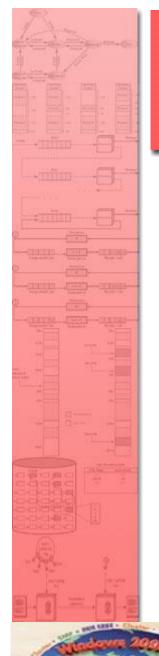

- Hardware is surrounded by the operating-system
- Operating system is called the kernel
- Comes with a number of user services and interfaces
 - shell
 - C compiler

UNIX

Modern UNIX Systems

- System V Release 4 (SVR4)
- Solaris 2.x
- 4.4BSD
- Linux
